

# The critical point, fluctuations, and Hydro+

M. Stephanov

with Y. Yin (MIT/IMP-Lanzhou), [1712.10305](#);  
with X. An, G. Basar and H.-U. Yee, [1902.09517](#);

# Critical point: intriguing hints

Where on the QCD phase boundary is the CP?

Equilibrium  $\kappa_4$   
vs  $T$  and  $\mu_B$ :

“intriguing hint” (2015 LRPNS)

Motivation for phase II of BES at RHIC and BEST topical collaboration.

Theory/experiment gap: predictions assume equilibrium, but

Non-equilibrium physics is essential near the critical point.

Challenge: develop hydrodynamics *with fluctuations* capable of describing *non-equilibrium* effects on critical-point signatures.

Also note:

Fluctuations are the first step to extend hydro to smaller systems.

- Hydrodynamic eqs. are conservation equations:

$$\partial_t \psi = -\nabla \cdot \text{Flux}[\psi];$$

# Stochastic hydrodynamics

- Hydrodynamic eqs. are conservation equations:

$$\partial_t \psi = -\nabla \cdot \text{Flux}[\psi];$$

- Stochastic** variables  $\check{\psi} = (\check{T}^{i0}, \check{J}^0)$  are local operators coarse-grained (over scale  $b \gg \ell_{\text{mic}} \sim c_s/T$  or  $\ell_{\text{mfp}}$ ):

more

$$\partial_t \check{\psi} = -\nabla \cdot \left( \text{Flux}[\check{\psi}] + \text{Noise} \right) \quad (\text{Landau-Lifshitz})$$

# Stochastic hydrodynamics

- Hydrodynamic eqs. are conservation equations:

$$\partial_t \psi = -\nabla \cdot \text{Flux}[\psi];$$

- Stochastic** variables  $\check{\psi} = (\check{T}^{i0}, \check{J}^0)$  are local operators coarse-grained (over scale  $b \gg \ell_{\text{mic}} \sim c_s/T$  or  $\ell_{\text{mfp}}$ ):

more

$$\partial_t \check{\psi} = -\nabla \cdot \left( \text{Flux}[\check{\psi}] + \text{Noise} \right) \quad (\text{Landau-Lifshitz})$$

- Linearized version has been considered and applied to heavy-ion collisions (Kapusta-Muller-MS, Kapusta-Torres-Rincon, ...)
- Non-linearities + point-like noise  $\Rightarrow$  UV divergences.  
In numerical simulations – cutoff dependence.

# Deterministic approach

- Variables are one- and two-point functions:

$\psi = \langle \check{\psi} \rangle$  and  $G = \langle \check{\psi}\check{\psi} \rangle - \langle \check{\psi} \rangle \langle \check{\psi} \rangle$  – equal-time correlator

$$\partial_t \psi = -\nabla \cdot \text{Flux}[\psi, G]; \quad (\text{conservation})$$

$$\partial_t G = \mathbb{L}[G; \psi]. \quad (\text{relaxation})$$

- In Bjorken flow by Akamatsu *et al*, Martinez-Schaefer.  
For arbitrary relativistic flow – by An *et al* (this talk).  
Earlier, in *nonrelativistic* context, – by Andreev in 1970s.

# Deterministic approach

- Variables are one- and two-point functions:

$$\partial_t \psi = -\nabla \cdot \text{Flux}[\psi, G]; \quad (\text{conservation})$$

$$\partial_t G = L[G; \psi]. \quad (\text{relaxation})$$

- In Bjorken flow by Akamatsu *et al*, Martinez-Schaefer.  
For arbitrary relativistic flow – by An *et al* (this talk).  
Earlier, in *nonrelativistic* context, – by Andreev in 1970s.
- Advantage: deterministic equations.

“Infinite noise” causes UV renormalization of EOS and transport coefficients – can be taken care of *analytically* ([1902.09517](#))

- Fluctuation dynamics near CP requires two main ingredients:
  - Critical fluctuations ( $\xi \rightarrow \infty$ )
  - Slow relaxation mode with  $\tau_{\text{relax}} \sim \xi^3$  (leading to  $\zeta \rightarrow \infty$ )

- Fluctuation dynamics near CP requires two main ingredients:
  - Critical fluctuations ( $\xi \rightarrow \infty$ )
  - Slow relaxation mode with  $\tau_{\text{relax}} \sim \xi^3$  (leading to  $\zeta \rightarrow \infty$ )
- Both described by the same object: the two-point function of the slowest hydrodynamic mode  $\check{m} = \delta(s/n)$ , i.e.,  $\langle \check{m}(x_1) \check{m}(x_2) \rangle$ .
- Without this mode, hydrodynamics would break down near CP when  $\tau_{\text{expansion}} \sim \tau_{\text{relax}} \sim \xi^3$ .

# Additional variables in Hydro+

- At the CP the *slowest* new variable is the 2-pt function  $\langle \check{m}\check{m} \rangle$  of the slowest hydro variable  $\check{m} = \delta(s/n)$ :

$$\phi_Q(\mathbf{x}) = \int_{\Delta\mathbf{x}} \langle \check{m}(\mathbf{x}_+) \check{m}(\mathbf{x}_-) \rangle e^{iQ \cdot \Delta\mathbf{x}}$$

where  $\mathbf{x} = (\mathbf{x}_+ + \mathbf{x}_-)/2$  and  $\Delta\mathbf{x} = \mathbf{x}_+ - \mathbf{x}_-$ .

- Wigner transformed b/c dependence on  $x$  ( $\sim L$ ) is much slower than on  $\Delta x$ . Scale separation similar to kinetic theory.

# Relaxation of fluctuations towards equilibrium

- As usual, equilibration maximizes entropy  $S = \sum_i p_i \log(1/p_i)$ :

$$s_{(+)}(\epsilon, n, \phi_{\mathbf{Q}}) = s(\epsilon, n) + \frac{1}{2} \int_{\mathbf{Q}} \left( \log \frac{\phi_{\mathbf{Q}}}{\bar{\phi}_{\mathbf{Q}}} - \frac{\phi_{\mathbf{Q}}}{\bar{\phi}_{\mathbf{Q}}} + 1 \right)$$

# Relaxation of fluctuations towards equilibrium

- As usual, equilibration maximizes entropy  $S = \sum_i p_i \log(1/p_i)$ :

$$s_{(+)}(\epsilon, n, \phi_Q) = s(\epsilon, n) + \frac{1}{2} \int_Q \left( \log \frac{\phi_Q}{\bar{\phi}_Q} - \frac{\phi_Q}{\bar{\phi}_Q} + 1 \right)$$

- Entropy = log # of states, which depends on the width of  $P(m_Q)$ , i.e.,  $\phi_Q$ :

- Wider distribution – more microstates  
– more entropy:  $\log(\phi/\bar{\phi})^{1/2}$  ;

VS

- Penalty for larger deviations from peak entropy (at  $\delta m = 0$ ):  $-(1/2)\phi/\bar{\phi}$ .

Maximum of  $s_{(+)}$  is achieved at  $\phi = \bar{\phi}$ .

# Hydro+ mode kinetics

- The equation for  $\phi_Q$  is a relaxation equation:

$$(u \cdot \partial)\phi_Q = -\gamma_\pi(Q)\pi_Q, \quad \pi_Q = - \left( \frac{\partial s_{(+)}}{\partial \phi_Q} \right)_{\epsilon, n}$$

$\gamma_\pi(Q)$  is known from mode-coupling calculation in 'model H'.

It is universal (Kawasaki function).

$\gamma_\pi(Q) \sim 2DQ^2$  for  $Q < \xi^{-1}$  and  $\sim Q^3$  for  $Q > \xi^{-1}$ .

more

- Characteristic rate:  $\Gamma(Q) \sim \gamma_\pi(Q) \sim \xi^{-3}$  at  $Q \sim \xi^{-1}$ .
- Slowness of this relaxation process is behind the divergence of  $\zeta \sim 1/\Gamma \sim \xi^3$  and the breakdown of *ordinary* hydro near CP.

# Towards a general deterministic formalism

*An, Basar, Yee, MS, [1902.09517](#)*

- To embed Hydro+ into a unified theory for critical as well as non-critical fluctuations we develop a general (deterministic, correlation function) hydrodynamic fluctuation formalism.

# Towards a general deterministic formalism

An, Basar, Yee, MS, 1902.09517

- To embed Hydro+ into a unified theory for critical as well as non-critical fluctuations we develop a general (deterministic, correlation function) hydrodynamic fluctuation formalism.

- Important issue in *relativistic* hydro – “equal-time” in the definition of

$$G(x, y) = \langle \phi(x + y/2) \phi(x - y/2) \rangle.$$

Addressed by constructing “confluent” derivative.

- Renormalization can be done *analytically*, and resulting renormalized equations are finite (cutoff-independent).

# Equal time

We want evolution equation for equal time correlator

$G = \langle \phi(t, \mathbf{x}_+) \phi(t, \mathbf{x}_-) \rangle$ . But what does “equal time” mean?

“Equal time” in  $\langle \phi(x_+) \phi(x_-) \rangle$  depends on the choice of frame.

The most natural choice is local  $u(x)$  (with  $x = (x_+ + x_-)/2$ ).

Derivatives wrt  $x$  at “ $y$ -fixed” should take this into account:

using  $\Lambda(\Delta x)u(x + \Delta x) = u(x)$ :

$$\Delta x \cdot \bar{\nabla} G(x, y) \equiv G(x + \Delta x, \Lambda(\Delta x)^{-1}y) - G(x, y).$$

not  $G(x + \Delta x, y) - G(x, y)$ .

# Confluent correlator, derivative and connection

Confluent two-point correlator:

$$\bar{G}(x, y) = \Lambda(y/2) G(x, y) \Lambda(-y/2)^T$$

and its derivative

$$\bar{\nabla}_\mu \bar{G}_{AB} = \partial_\mu \bar{G}_{AB} - \bar{\omega}_{\mu A}^C \bar{G}_{CB} - \bar{\omega}_{\mu B}^C \bar{G}_{AC} - \bar{\omega}_{\mu a}^b y^a \frac{\partial}{\partial y^b} \bar{G}_{AB}.$$

Connection  $\bar{\omega}$  makes sure that only the change of  $\phi_A$  *relative* to local rest frame  $u$  is counted.

Connection  $\bar{\omega}$  corrects for a possible rotation of the local basis triad  $e_a$  defining local coordinates  $y^a$ . The derivative is independent of  $e_a$ .

We then define the Wigner transform  $W_{AB}(x, q)$  of  $\bar{G}_{AB}(x, y)$ .

# Scales

- Hydro cell size  $b$ : coarse-grain quantum operators over scale  $b \gg \ell_{\text{mic}}$  to leave only slow modes for which quantum fluctuations are negligible compared to thermal, i.e.,  $\hbar\omega \ll kT$ .

$$\ell_{\text{mic}} \sim \ell_{\text{mfp}}, c_s/T.$$

$\check{\psi} = (\check{T}^{i0}, \check{J}^0)$  are *classical* stochastic variables.

- Hydrodynamic gradients scale  $L$ : must be  $L \gg b$ .

back

- Size of local equilibrium cell  $\ell_{\text{eq}} \equiv \ell_*$ : diffusion length in evolution time scale, typically  $\tau_{\text{ev}} \sim L/c_s$

$$\ell_* \sim \sqrt{\gamma\tau_{\text{ev}}} \sim \sqrt{\gamma L/c_s}.$$

- $b \ll L$  implies the hierarchy:

$$\ell_{\text{mic}} \ll b < \ell_* \ll L \quad \text{or} \quad T/c_s \gg \Lambda > q_* \gg k \quad (\gamma q_*^2 = c_s k)$$

# Matrix equation and diagonalization

After many nontrivial cancellations we find evolution eq.:

$$u \cdot \bar{\nabla} W = -i[\mathbb{L}^{(q)}, W] - \frac{1}{2}\{\bar{\mathbb{L}}, W\} + 2T w \mathbb{Q}^{(q)} + \mathcal{K} \circ W + \mathcal{K}' \circ q \circ \frac{\partial W}{\partial q}$$

where

expand

$$\text{Ideal hydro} \rightarrow \mathbb{L}^{(q)} \equiv c_s \begin{pmatrix} 0 & q_\nu \\ q_\mu & 0 \end{pmatrix}, \quad \bar{\mathbb{L}} \equiv c_s \begin{pmatrix} 0 & \bar{\nabla}_{\perp\nu} \\ \bar{\nabla}_{\perp\mu} & 0 \end{pmatrix},$$

$$\text{Noise} \rightarrow \mathbb{Q} \sim \gamma q^2, \quad \text{and} \quad \text{Background} \rightarrow \mathcal{K} \sim \mathcal{K}' \sim \partial_\mu u_\nu.$$

# Matrix equation and diagonalization

After many nontrivial cancellations we find evolution eq.:

$$u \cdot \bar{\nabla} W = -i[\mathbb{L}^{(q)}, W] - \frac{1}{2}\{\bar{\mathbb{L}}, W\} + 2T w \mathbb{Q}^{(q)} + \mathcal{K} \circ W + \mathcal{K}' \circ q \circ \frac{\partial W}{\partial q}$$

where

expand

$$\text{Ideal hydro} \rightarrow \mathbb{L}^{(q)} \equiv c_s \begin{pmatrix} 0 & q_\nu \\ q_\mu & 0 \end{pmatrix}, \quad \bar{\mathbb{L}} \equiv c_s \begin{pmatrix} 0 & \bar{\nabla}_{\perp\nu} \\ \bar{\nabla}_{\perp\mu} & 0 \end{pmatrix},$$

$$\text{Noise} \rightarrow \mathbb{Q} \sim \gamma q^2, \quad \text{and} \quad \text{Background} \rightarrow \mathcal{K} \sim \mathcal{K}' \sim \partial_\mu u_\nu.$$

The leading term  $\mathbb{L}^{(q)}$  is oscillatory:  $[\mathbb{L}^{(q)}, W]_{\mathbf{AB}} = (\lambda_{\mathbf{A}} - \lambda_{\mathbf{B}})W_{\mathbf{AB}}$ , where  $\lambda_{\mathbf{A}} = \pm c_s |q|, 0, 0, 0$ , eigenvalues of  $\mathbb{L}^{(q)}$  – linear ideal hydro.

Averaging over times shorter than  $(c_s |q|)^{-1}$  leaves only 5 modes in  $W$ : 2 sound-sound  $W_{++}, W_{--}$  and 2x2 transverse<sup>2</sup>  $\widehat{W}_{ij}$ . [see equations](#)

# Sound-sound correlation and phonon kinetic equation

$$\underbrace{\left[ (u + v) \cdot \bar{\nabla} + f \cdot \frac{\partial}{\partial q} \right]}_{\mathcal{L}_+[W_+]} W_+ = -\gamma_L q^2 (W_+ - \underbrace{Tw}_{W^{(0)}}) + \underbrace{\mathcal{K}''}_{\sim \partial_\mu u_\nu, a_\mu} W_+$$

expand

# Sound-sound correlation and phonon kinetic equation

$$\underbrace{\left[ (u + v) \cdot \bar{\nabla} + f \cdot \frac{\partial}{\partial q} \right]}_{\mathcal{L}_+[W_+]} W_+ = -\gamma_L q^2 (W_+ - \underbrace{T w}_{W^{(0)}}) + \underbrace{\mathcal{K}''}_{\sim \partial_\mu u_\nu, a_\mu} W_+$$

expand

Three nontrivial observations:

🟢 For a phonon  $q \cdot u(x) = E(q_\perp)$ , where  $E = c_s(x)|q_\perp|$ :

$$v = c_s \hat{q}_\perp,$$

$$f_\mu = \underbrace{-E(a_\mu + 2v^\nu \omega_{\nu\mu})}_{\text{inertial + Coriolis}} \underbrace{-q_{\perp\nu} \partial_{\perp\mu} u^\nu}_{\text{"Hubble"}} - \bar{\nabla}_{\perp\mu} E.$$

# Sound-sound correlation and phonon kinetic equation

$$\underbrace{\left[ (u + v) \cdot \bar{\nabla} + f \cdot \frac{\partial}{\partial q} \right]}_{\mathcal{L}_+[W_+]} W_+ = -\gamma_L q^2 (W_+ - \underbrace{T w}_{W^{(0)}}) + \underbrace{\mathcal{K}''}_{\sim \partial_\mu u_\nu, a_\mu} W_+$$

expand

Three nontrivial observations:

- For a phonon  $q \cdot u(x) = E(q_\perp)$ , where  $E = c_s(x)|q_\perp|$ :

$$v = c_s \hat{q}_\perp,$$

$$f_\mu = \underbrace{-E(a_\mu + 2v^\nu \omega_{\nu\mu})}_{\text{inertial + Coriolis}} \underbrace{-q_{\perp\nu} \partial_{\perp\mu} u^\nu}_{\text{"Hubble"}} - \bar{\nabla}_{\perp\mu} E.$$

- Rescaling  $N_+ = W_+ / (w c_s |q|)$  eliminates  $\mathcal{K}''$  terms:

$$\mathcal{L}_+[N_+] = -\gamma_L q^2 (N_+ - \underbrace{T/E})$$

$E \rightarrow 0$  of eqIBM. BE dist.

- Contribution of  $W_+$  to  $T^{\mu\nu}$  matches phonon gas with d.f.  $N_+$ .

# Renormalization

Expansion of  $\langle T^{\mu\nu} \rangle$  contains  $\langle \phi(x)\phi(x) \rangle = G(x, 0) = \int \frac{d^3q}{(2\pi)^3} W(x, q)$ .

This integral is divergent (equilibrium  $G^{(0)}(x, y) \sim \delta^3(y)$ ).

# Renormalization

Expansion of  $\langle T^{\mu\nu} \rangle$  contains  $\langle \phi(x)\phi(x) \rangle = G(x, 0) = \int \frac{d^3q}{(2\pi)^3} W(x, q)$ .

This integral is divergent (equilibrium  $G^{(0)}(x, y) \sim \delta^3(y)$ ).

$$W(x, q) \sim \underbrace{W^{(0)}}_{T w} + \underbrace{W^{(1)}}_{\partial u / q^2} + \widetilde{W}$$

(~“OPE” or gradient expansion)

expand

# Renormalization

Expansion of  $\langle T^{\mu\nu} \rangle$  contains  $\langle \phi(x)\phi(x) \rangle = G(x, 0) = \int \frac{d^3q}{(2\pi)^3} W(x, q)$ .

This integral is divergent (equilibrium  $G^{(0)}(x, y) \sim \delta^3(y)$ ).

$$W(x, q) \sim \underbrace{W^{(0)}}_{T w} + \underbrace{W^{(1)}}_{\partial u / q^2} + \widetilde{W}$$

(~“OPE” or gradient expansion)

expand

$$G(x, 0) \sim \underbrace{\Lambda^3}_{\text{ideal (EOS)}} + \underbrace{\Lambda \partial u}_{\text{visc. terms}} + \underbrace{\widetilde{G}}_{\text{finite “}\partial^3/2\text{”}}$$

# Renormalized equations

Expand  $T^{\mu\nu}$  in fluctuations and average over noise.

*Local* cutoff-dependent terms absorbed into EOS and visc. coeffs.:

$$T_R^{\mu\nu}(x) = (\epsilon u^\mu u^\nu + p(\epsilon) \Delta^{\mu\nu} + \Pi^{\mu\nu})_R + \underbrace{\frac{1}{w} \left[ \left( \dot{c}_s \tilde{G}_{ee}(x) - c_s^2 \tilde{G}_\lambda^\lambda(x) \right) \Delta^{\mu\nu} + \tilde{G}^{\mu\nu}(x) \right]}_{\text{local in } \tilde{G}, \text{ but not in } u, \epsilon}.$$

And we obtain finite (cutoff independent) system of equations:

$$\begin{cases} \partial_\mu T_R^{\mu\nu} & = & 0; \\ u \cdot \bar{\nabla} \tilde{W} & = & \dots \end{cases}$$

describing evolution of hydrodynamic variables and their fluctuations.

# In progress

🔴 *Xin An's talk at QM, Wednesday:*

- 🟢 Add baryon charge.
- 🟢 Merge with Hydro+. Unify critical and non-critical fluctuations.

Next-to-slowest modes: density-shear and shear-shear correlator.  
Extending Hydro+ closer to the CP (shorter gradients or larger  $\xi$ ).

# Outlook (to-do-list)

- Add higher-order correlators for *non-gaussian* fluctuations.
- Connect *fluctuating* hydro with freezeout kinetics and implement in full hydrodynamic code and event generator.  
Compare with experiment.
- First-order transition in fluctuating hydrodynamics?
- Connection to action principle (SK) formulation.

More

# Separation of scales

$$G(x, y) = \langle \phi(x + y/2) \phi(x - y/2) \rangle$$

depends on  $x$  slowly ( $L$ ), but on  $y$  – fast ( $\ell_{\text{eq}} \sim \sqrt{L} \ll L$ ).

Similar to separation of scales in QFT in kinetic regime. ( $q \gg k$ )

# Critical fluctuations

- Near CP there is *parametric* separation of relaxation time scales.

The slowest and thus most out-of-equilibrium mode is charge diffusion at const  $p$ :  $\delta(s/n) \equiv m$ .

[back](#)

# Critical fluctuations

- Near CP there is *parametric* separation of relaxation time scales.

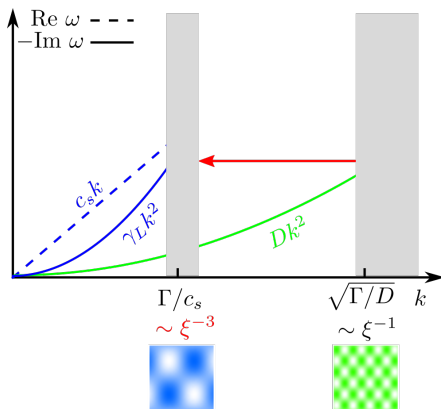

The slowest and thus most out-of-equilibrium mode is charge diffusion at const  $p$ :  $\delta(s/n) \equiv m$ .

[back](#)

- Rate of  $m$  at scale  $k \sim \xi^{-1}$ ,

$$\Gamma \sim D\xi^{-2} \sim \xi^{-3},$$

is of order of that for **sound** at much smaller  $k \sim \xi^{-3}$ .

# Critical fluctuations

- Near CP there is *parametric* separation of relaxation time scales.

[back](#)

- Rate of  $m$  at scale  $k \sim \xi^{-1}$ ,

$$\Gamma \sim D\xi^{-2} \sim \xi^{-3},$$

is of order of that for **sound** at much smaller  $k \sim \xi^{-3}$ .

- The effect of  $m$  fluctuations,  $1/\sqrt{V}$ , is  $(k\xi)^{3/2} = \mathcal{O}(1)$ !

# Critical fluctuations

- Near CP there is *parametric* separation of relaxation time scales.

The slowest and thus most out-of-equilibrium mode is charge diffusion at const  $p$ :  $\delta(s/n) \equiv m$ .

[back](#)

- Rate of  $m$  at scale  $k \sim \xi^{-1}$ ,

$$\Gamma \sim D\xi^{-2} \sim \xi^{-3},$$

is of order of that for **sound** at much smaller  $k \sim \xi^{-3}$ .

- The effect of  $m$  fluctuations,  $1/\sqrt{V}$ , is  $(k\xi)^{3/2} = \mathcal{O}(1)$ !

- Thus we need  $\langle mm \rangle$  as the independent variable(s) in hydro+ equations.

# Hydro+ vs Hydro: real-time bulk response

Hydrodynamics breaks down for processes faster than  $\Gamma_\xi \sim \xi^{-3} \rightarrow$  **Hydro+**

- Stiffness of eos (sound speed) is underestimated in hydro (---):

$c_s \rightarrow 0$  at CP, but only modes with  $\omega \ll \Gamma_\xi$  are critically soft.

- Dissipation during expansion is overestimated in hydro (---):

$\zeta \rightarrow \infty$  at CP, but only modes with  $\omega \ll \Gamma_\xi$  experience large  $\zeta$ .

# Linearized fluctuation equations

back

$$u \cdot \partial \phi_A = -(\mathbb{L} + \mathbb{Q} + \mathbb{K})_{AB} \phi^B - \xi_A,$$

$$\mathbb{K} \equiv \begin{pmatrix} (1 + c_s^2 + \dot{c}_s) \theta & 2c_s a_\nu \\ \frac{1 + c_s^2 - \dot{c}_s}{c_s} a_\mu & -u_\mu a_\nu + \partial_{\perp \nu} u_\mu + \Delta_{\mu\nu} \theta \end{pmatrix}, \quad \xi \equiv (0, \Delta_{\mu\kappa} \partial_\lambda \check{S}^{\lambda\kappa})$$

$$\langle \xi_A(x_+) \xi_B(x_-) \rangle = 2T w \mathbb{Q}_{AB}^{(y)} \delta^3(y_\perp).$$

$$u \cdot \partial G_{AB}(x, y) = -(\mathbb{L}^{(y)} + \frac{1}{2} \mathbb{L} + \mathbb{Q}^{(y)} + \mathbb{K} + \mathbb{Y})_{AC} G^C_B(x, y)$$

$$- (-\mathbb{L}^{(y)} + \frac{1}{2} \mathbb{L} + \mathbb{Q}^{(y)} + \mathbb{K} + \mathbb{Y})_{BC} G^C_A(x, y)$$

$$+ 2T w \mathbb{Q}_{AB}^{(y)} \delta^3(y_\perp),$$

# Correlation matrix evolution equation

back

$$u \cdot \bar{\nabla} W(x; q) = - \left[ i\mathbb{L}^{(q)} + \mathbb{K}^{(a)}, W \right] - \left\{ \frac{1}{2} \bar{\mathbb{L}} + \mathbb{Q}^{(q)} + \mathbb{K}^{(s)}, W \right\} + \theta W + 2T w \mathbb{Q}^{(q)} + (\partial_{\perp\lambda} u_{\mu}) q^{\mu} \frac{\partial W}{\partial q_{\lambda}} \\ + \frac{1}{2} a_{\lambda} \left\{ \left( 1 - \frac{\dot{c}_s}{c_s^2} \right) \mathbb{L}^{(q)}, \frac{\partial W}{\partial q_{\lambda}} \right\} + \frac{\partial}{\partial q_{\lambda}} \left( \{ \Omega_{\lambda}^{(s)}, W \} + [\Omega_{\lambda}^{(a)}, W] - \frac{1}{4} [\mathbb{H}_{\lambda}, [\mathbb{L}^{(q)}, W]] \right),$$

where

$$\mathbb{L}^{(q)} \equiv c_s \begin{pmatrix} 0 & q_{\nu} \\ q_{\mu} & 0 \end{pmatrix}, \quad \bar{\mathbb{L}} \equiv c_s \begin{pmatrix} 0 & \bar{\nabla}_{\perp\nu} \\ \bar{\nabla}_{\perp\mu} & 0 \end{pmatrix}, \quad \mathbb{Q}^{(q)} \equiv \begin{pmatrix} 0 & 0 \\ 0 & \gamma_{\eta} \Delta_{\mu\nu} q^2 + \left( \gamma_{\zeta} + \frac{1}{3} \gamma_{\eta} \right) q_{\mu} q_{\nu} \end{pmatrix}, \\ \mathbb{K}^{(s)} \equiv \begin{pmatrix} (1 + c_s^2 + \dot{c}_s) \theta & \frac{1}{2c_s} (1 + 2c_s^2) a_{\nu} \\ \frac{1}{2c_s} (1 + 2c_s^2) a_{\mu} & \Delta_{\mu\nu} \theta + \theta_{\mu\nu} \end{pmatrix}, \quad \mathbb{K}^{(a)} \equiv \begin{pmatrix} 0 & -\frac{1 - c_s^2 - \dot{c}_s}{2c_s} a_{\nu} \\ \frac{1 - c_s^2 - \dot{c}_s}{2c_s} a_{\mu} & -\omega_{\mu\nu} \end{pmatrix}, \\ \Omega_{\lambda}^{(s)} \equiv \frac{c_s^2}{2} \begin{pmatrix} 2\omega_{\kappa\lambda} q^{\kappa} & 0 \\ 0 & \omega_{\mu\lambda} q_{\nu} + \omega_{\nu\lambda} q_{\mu} \end{pmatrix}, \quad \Omega_{\lambda}^{(a)} \equiv \frac{c_s^2}{2} \begin{pmatrix} 0 & 0 \\ 0 & \omega_{\mu\lambda} q_{\nu} - \omega_{\nu\lambda} q_{\mu} \end{pmatrix}, \\ \mathbb{H}_{\lambda} \equiv c_s \begin{pmatrix} 0 & \partial_{\nu} u_{\lambda} \\ \partial_{\mu} u_{\lambda} & 0 \end{pmatrix}, \\ \theta^{\mu\nu} = \frac{1}{2} \left( \partial_{\perp}^{\mu} u^{\nu} + \partial_{\perp}^{\nu} u^{\mu} \right), \quad \theta = \theta_{\mu}^{\mu}, \quad \omega_{\mu\nu} = \frac{1}{2} (\partial_{\perp\mu} u_{\nu} - \partial_{\perp\nu} u_{\mu}).$$

## Sound-sound

$$\begin{aligned} & (u \pm c_s \hat{q}) \cdot \bar{\nabla} W_{\pm} - \left( \pm \left( c_s - \frac{\dot{c}_s}{c_s} \right) |q| a_{\mu} + (\partial_{\perp\mu} u_{\nu}) q^{\nu} + 2c_s^2 q^{\lambda} \omega_{\lambda\mu} \right) \frac{\partial W_{\pm}}{\partial q_{\mu}} \\ & = -\gamma_L q^2 (W_{\pm} - T w) - \left( (1 + c_s^2 + \dot{c}_s) \theta + \theta_{\mu\nu} \hat{q}^{\mu} \hat{q}^{\nu} \pm \frac{1 + 2c_s^2}{c_s} \hat{q} \cdot a \right) W_{\pm}, \end{aligned}$$

# Wigner function equations

## Sound-sound

$$\begin{aligned} & (u \pm c_s \hat{q}) \cdot \bar{\nabla} W_{\pm} - \left( \pm \left( c_s - \frac{\dot{c}_s}{c_s} \right) |q| a_{\mu} + (\partial_{\perp\mu} u_{\nu}) q^{\nu} + 2c_s^2 q^{\lambda} \omega_{\lambda\mu} \right) \frac{\partial W_{\pm}}{\partial q_{\mu}} \\ & = -\gamma_L q^2 (W_{\pm} - Tw) - \left( (1 + c_s^2 + \dot{c}_s) \theta + \theta_{\mu\nu} \hat{q}^{\mu} \hat{q}^{\nu} \pm \frac{1 + 2c_s^2}{c_s} \hat{q} \cdot a \right) W_{\pm}, \end{aligned}$$

## Shear-shear

$$u \cdot \bar{\nabla} \widehat{W} = -2q^2 \gamma_{\eta} (\widehat{W} - Tw \widehat{\mathbb{1}}) + (\partial_{\perp\mu} u_{\nu}) q^{\nu} \nabla_{(q)}^{\mu} \widehat{W} - \left\{ \widehat{K}, \widehat{W} \right\} + \left[ \widehat{\Omega}, \widehat{W} \right],$$

where

$$\widehat{K}^{ij} \equiv \frac{1}{2} \theta \delta^{ij} + \theta^{\mu\nu} t_{\mu}^{(i)} t_{\nu}^{(j)}, \quad \text{and} \quad \widehat{\Omega}^{ij} \equiv \omega^{\mu\nu} t_{\mu}^{(i)} t_{\nu}^{(j)}, \quad i = 1, 2;$$

[go back](#)

# Large $q$ behavior of $W$

The part which does not lead to UV divergences:

$$\widetilde{W} = W - W^{(0)} - W^{(1)}$$

The equilibrium part (the divergent integral renormalizes EOS):

$$W_{\pm}^{(0)} = Tw \quad \text{and} \quad W_{T_i, T_j}^{(0)} = Tw \delta_{ij}.$$

The first background gradient correction  
(integral renormalizes viscosities):

$$W_{\pm}^{(1)}(x, q) = \frac{Tw}{\gamma_L q^2} \left( (c_s^2 - \dot{c}_s) \theta - \theta_{\mu\nu} \hat{q}^\mu \hat{q}^\nu \right),$$
$$W_{T_i T_j}^{(1)}(x, q) = \frac{Tw}{\gamma_\eta q^2} \left( c_s^2 \theta \delta^{ij} - \theta^{\mu\nu} t_\mu^{(i)} t_\nu^{(j)} \right).$$

# Universality and mapping of QCD to Ising model

- The EOS is an essential input for hydro.

Near CP universality means

$$P_{\text{QCD}}(\mu, T) = -G_{\text{Ising}}(h, r) + \text{less singular terms}$$

$G_{\text{Ising}}(h, r)$  is universal and known,

but the mapping given by  $h = h(\mu, T)$  and  $r = r(\mu, T)$  is not.

# Universality and mapping of QCD to Ising model

- The EOS is an essential input for hydro.

Near CP universality means

$$P_{\text{QCD}}(\mu, T) = -G_{\text{Ising}}(h, r) + \text{less singular terms}$$

$G_{\text{Ising}}(h, r)$  is universal and known,

but the mapping given by  $h = h(\mu, T)$  and  $r = r(\mu, T)$  is not.

- While  $h = 0$  is the transition line, what is  $r = 0$ ?

Slope of  $r = 0 \Leftrightarrow$  asymmetry of EOS around transition line:

The skewness, or  $\chi_3$ , can be 0, + or - depending on  $r = 0$  slope.

# Universality of mapping for small $m_q$

- In the limit of  $m_q \rightarrow 0$  the critical point is close to a tricritical point.

- The  $(\mu, T)/(h, r)$  mapping becomes singular in a *universal* way: the slope difference vanishes as  $\sim m_q^{2/5}$ . Pradeep, MS, [1905.13247](#)

Consequences:

- The  $r = 0$  axis is almost horizontal. Not  $\perp$  to  $h = 0$ .
- $r = 0$  slope is possibly negative (it is in RMM). Then skewness is negative on the crossover line ( $h = 0$ ) and below, at freezeout.
